

Jupiter burst February 27th

- Predicted Jupiter burst 2:15-4:30 UT
- Observation from 2:15-5:15 UT
- Jupiter ($\delta = -22^\circ$) rises at 2:45 and culminates at 6:15 at 16° elevation.
- Asked for subbands 155-166 plus 183 thru 186
- Got subbands at higher frequencies except subband 170 (26.5 Mhz).
- Troubled by RFI

Aips++ autoflagger

- `include 'autoflag.g'`
- `af:=autoflag('L2007_01585_SB8-9_flagged.MS');`
- `af.setdata();`
- `af.setfreqmed(thr=5,hw=12,rowthr=5,rowhw=20,column='CORR',figignore=T);`
- `af.settimemed(thr=5,hw=10,rowthr=5,rowhw=10,column='CORR',figignore=T);`
- `af.run(reset=T,trial=F,plotdev=4,devfile='flagrep.ps/ps');`

Conclusions

- Dirty image looks like the dirty beam, but inverted.
- We see fringes, but is there a source?
